## (54) CONNECTION TERMINAL

### (57)Abstract:

**PURPOSE:** To obtain a connection terminal used for mounting chip components on a board by a method wherein a fixing part fixed on a board by soldering or adhesion is formed by bending in an L shape at one end of a strip of conductive member, and a springy electrode part elastically abutting with an end of a chip component by bending in the same side as one end at the other end.

**CONSTITUTION:** A fixing part 1 fixed on a board 12 by soldering or adhesion is formed by bending almost in an L shape at one end of a strip of conductive member, and a springy electrode part 2 elastically abutting with an end of a chip component 13 by bending in the same side as one end at the other end. Two connection terminals 10, 11 are counterposed on the board with a suitable distance apart, and a chip component 13 is mounted by insertion between springy electrode parts 2 facing each other. Since the chip component is floating from the printed board or the like by the thickness of a soldering part, the printed board or the like is not damaged during replacement of chip components with the result that quality improves. If there are spaces enough, it is possible to add chip components easily, and facilitate improvement work.

## LEGAL STATUS

[Date of request for examination]

• [Date of sending the examiner's decision of rejection]

[Kind of final disposal of application other than the examiner's decision of rejection or application converted registration]
